

Tyler Kleint

Linux Systems Administrator

Bronx, New York · tyleralk@gmail.com · github.com/OffensiveGeneric · linkedin.com/in/tyler-laboe-kleint

SUMMARY

Linux systems administrator and Computer Science graduate focused on university research computing, multiuser Linux services, and hybrid cloud infrastructure. Builds and operates Ubuntu, Docker, Kubernetes, JupyterHub, Nginx, VMware, Azure, and AWS environments using Bash, SSH, Python, and documented operational workflows.

EXPERIENCE

January 2020 – December 2024

Junior Systems Administrator — The City College of New York, Computer Science Department · New York, NY

- Administered a multiuser Linux lab supporting university research and Computer Science instruction.
- Deployed and maintained Ubuntu servers, JupyterHub services, Nginx reverse proxies, and TLS certificates issued through Let's Encrypt.
- Automated remote administration with Bash and SSH and operated DNS, DHCP, LDAP, VMware, and infrastructure-monitoring services.
- Administered hybrid Azure, AWS, and on-premises infrastructure and diagnosed Linux service, network-connectivity, and access issues.

CURRENT INFRASTRUCTURE WORK

2025 – Present

Glasslab Kubernetes Infrastructure — Independent research-computing lab

- Built and administered a multi-node Kubernetes lab with Docker-based workloads, NVIDIA GPU workers, and Linux-hosted services.
- Automated PXE provisioning, node configuration, package maintenance, and repeatable operational checks with Ansible, Bash, and documented runbooks.
- Operated cluster networking, secrets, image distribution, workflow services, and incident-oriented validation from a dedicated Linux provisioner.

2026 – Present

Distributed GPU Inference Lab — Independent infrastructure project · local fork of exo

- Configured a two-node Apple Silicon Mac Studio cluster for distributed MLX inference over Thunderbolt using JACCL.
- Developed test harnesses for rank assignment, ring communication, and collective completion while diagnosing placement and post-connect failures in a local exo fork.
- Established static networking and SSH forwarding between macOS model servers and a Linux orchestration client, documenting repeatable launch and recovery procedures.

SELECTED PROJECTS

2025 – 2026

ADNS — Anomaly Detection Network System — Computer Science senior project

- Designed Python ingestion services and a Flask/Gunicorn API for network-flow data.
- Implemented Isolation Forest anomaly scoring, database-backed REST endpoints, and a React/Vite monitoring dashboard.
- Deployed and operated the application on DigitalOcean Ubuntu with Nginx, systemd, SSH, and documented service controls.

2026 – Present

Personal Website and Delivery Pipeline — Astro engineering and deployment project

- Built a server-rendered Astro and TypeScript site with semantic HTML, accessible responsive images, and minimal client-side JavaScript.
- Automated production releases through GitHub Actions with health-checked deployment to a Node service behind Caddy on Ubuntu.

TECHNICAL SKILLS

Systems: Linux, Ubuntu, macOS, systemd, VMware, JupyterHub, Nginx, Caddy

Infrastructure: Docker, Kubernetes, Ansible, Containers, Azure, AWS, DigitalOcean, GitHub Actions, CI/CD

Networking & Operations: TCP/IP, DNS, DHCP, LDAP, SSH, TLS, Troubleshooting, Patching, Service recovery, Runbooks

Development & Data: Bash, Python, FastAPI, Flask, REST APIs, PostgreSQL, MySQL, Git, MLX, JACCL

EDUCATION

Bachelor of Science in Computer Science

The City College of New York · December 2025
